NGINX Deployment

Project 1

Student: Jason Dartt

Goal

Run the PHP API through NGINX instead of the built-in PHP test server.

NGINX config

```
server {
    listen 80;
    server_name localhost;
    root /home/project_1/code; # Make this matches your exact folder path

    index index.php;

    location / {
        try_files $uri $uri/ /index.php?$query_string;
    }

    location ~ \.php$ {
        include snippets/fastcgi-php.conf;

        # Ensure php8.4-fpm.sock matches the php version you have
        fastcgi_pass unix:/var/run/php/php8.4-fpm.sock;
        fastcgi_param SCRIPT_FILENAME $document_root$fastcgi_script_name;
        include fastcgi_params;
    }
}
```

Verifying the path

Before starting nginx use this to ensure the correct permissions are in place.

```
sudo chmod -R 755 /filepath/
```

Use `sudo nginx -t` to check the config before starting

Starting the server

replace php8.3 with your installed version

```
sudo systemctl restart php8.3-fpm
sudo systemctl restart nginx
```

Screen Capture

```
curl http://localhost/
```
